Optifarm Collaborates with FarmResult to Enhance Livestock Data Integration and Analysis

3rd August 2024

“Adding Specific Intelligence”

We are excited to announce a new collaboration between Optifarm and FarmResult, uniting our expertise to transform livestock management through enhanced data integration and analysis. This collaboration aims to provide farmers with comprehensive insights and actionable intelligence, enabling them to optimise their operations and improve animal welfare.

FarmResult’s platform enables automatic data entry by connecting to various farm equipment such as climate computers, weighers, feed computers, and egg counters. By integrating automated and manual data.

Optifarm, renowned for its innovative livestock intelligence, introduces a layer of targeted intelligence to the data captured by FarmResult. By analysing critical parameters such as water use, temperature, and static pressure, Optifarm identifies anomalies and provides actionable insights in real-time. This allows farmers to make immediate decisions, enhancing productivity and validating animal welfare.

Richard, CEO of FarmResult, shared excitement about the collaboration: "Optifarm is the ideal extension to FarmResult's data capture abilities. With the scale and connection to all major farm equipment, FarmResult captures water, climate, feed, egg counts, and weight in every house. Optifarm adds specific intelligence on top of all that data."

Key Benefits of the Collaboration

- **Comprehensive Data Integration**: Seamlessly integrates data from various farm equipment with manual inputs, providing a complete picture of farm operations.

- **Enhanced Predictive Analytics**: Utilises advanced AI to analyse critical parameters, offering actionable insights and proactive solutions.

- **Benchmarking and Planning**: Enables farmers to benchmark their performance against peers and industry standards and provides planning and signalling abilities for efficient operations.

- **Real-Time Decision Making**: Delivers real-time insights directly to mobile phones and farm offices, allowing immediate decision-making to optimise productivity and validate animal welfare.
