

Multi-Site Appraisal

Below is a sample of our multiple farm insights reporting. This report is a true reflection of our service with farm names changed to protect confidentiality and privacy.

Multi-Site Appraisal

Analysing data across various farms reveals that 'Ventilation Decreased' is the most prevalent issue followed by 'Ventilation Increased' and then variations in 'Internal Temperature' changes.

Oak Gove Farm reported the highest number of increased ventilation issues, indicating potential overcompensation for other environmental control problems.

Maple Ridge and Cedar Crest are the top two farms reporting the most issues, indicating either higher diligence in monitoring or more significant challenges in managing their environments.

On the other hand, Pine Haven and Birchwood Meadows reported fewer issues, which could suggest either fewer operational challenges or less rigorous reporting practices.

This data suggests a broad spectrum of environmental control challenges across the farms, with ventilation management being a common concern. The variation in the type and frequency of issues reported by each farm could reflect differences in farm management practices, environmental conditions, or reporting rigor.
